A restaurant provides facility for their customers to check the price of the food items using an online menu. The menu details (item code, description and price) are stored in a text file called "menu.dat". Complete the following C code to display the menu on the screen.

A sample of menu.dat file is given below (ignore the headings)

Item code	description	price
S1	Prawns	675.00
S2	Fish	850.00
S3	Chicken	575.00

```
#include <stdio.h>

int main(void)
{
    .....
    .....
    .....
    .....
    return 0;
}

A bank uses a function called newBalance() to calculate the new account balance of a customer when the transaction type( w - withdrawal , d - deposit), deposit or withdrawal amount and current balance are given.

Implement a function called newBalance() which takes the transaction type(w - withdrawal , d - deposit), amount and current balance as parameters and calculate and return the new balance.

e.g. for withdrawal , new balance = current balance - amount  
for deposit, new balance = current balance + amount

Flag question

Select incorrect statement/s regarding "w" file opening mode.

FILE \*ptr;

ptr = fopen("readMe.dat", "w");

Select one:

- ☐ 1. If the file doesn't exist, the file pointer will be always null
- ☐ 2. The "readMe.dat" file will be empty
- ☐ 3. The content will be added to the beginning of the file
- ☐ 4. If the file exist, it will over write the previous content.
- ☐ 5. If the file doesn't exist, a new file will be created.

Question 7  
Not yet answered  
Marked out of 2.00  
Flag question

A student has written the following C code to calculate the average height of students in the class. The program should read the heights from the keyboard until the user input -99. However program executes in an infinite loop.

```
float height, total, avg;  
int count = 0;  
printf("Pls input the height");  
scanf("%f", &height);  
while ( height != -99)  
{  
    total = total + height;  
}  
avg = total / 5;  
printf("%f", avg);
```

Select the reason to have a infinite loop during execution.

Select one:

1. The condition in the while loop is incorrect.
2. The total and avg variables are not initialized.
3. The scanf statement to take the keyboard inputs is not included inside the loop.
4. The count variable is not initialize with 1.
5. The value of count variable has not been changed inside the loop.

Suppose that 10 students face an aptitude test at SLIIT and the marks are stored in an array called **marks**. You are asked to complete the following C program to find the number of pass and fail students. The pass mark is the average mark of the students.

```
#include <stdio.h>
```

```
int main(void)
```

```
{
```

```
    float marks[10] = { 75.00, 45.00, 61.00, 91.00, 55.00, 43.00, 78.00, 56.00, 95.00, 12.00};
```

```
    .....
```

```
    .....
```

```
    .....
```

```
    return 0;
```

```
}
```

A shop maintains the item list in a text file called "item.dat". Complete the following C code to input the item details ( item code , description , unit price, quantity) of 5 products from the keyboard and add new records to the existing file.

A sample of existing file is given below.

001 Sugar 135.00 150

002 Milk 345.00 55

003 Rice 98.00 200

```
#include <stdio.h>
```

```
int main(void)

## Sri Lanka Institute of Information Technology

Copy and modify the given program to apply the coding conventions.

A bank states their interest rate of savings accounts and fixed deposits for the balance amount of the bank account. If the bank account holder's age is considered as senior citizens.

Account Type		Interest Rate
Savings Account (S)	Current amount <= 8000	4%
	Current amount > 8000	8%
Fixed Deposits (F)	Current amount <= 8000	10%
	Current amount > 8000	15%

User inputs the account type, balance amount of the account and the age of the account holder. The program should calculate and display the corresponding interest amount. The program should take user inputs until the user enters an age less than 60. (Not a senior citizen).

```
#include <stdio.h>
int main()
{
    float balance, interestAmount;
    char type, answer;
    int age;
    printf("Enter age of the account holder: ");
    scanf("%d", &age);

## Online Exams

Sri Lanka Institute of Information Technology

Copy and modify the given program to apply the coding conventions.

A bank states their interest rate of savings accounts and fixed deposits for senior citizens. The interest rate depends on the balance amount of the bank account. If the bank account holder's age is greater than or equals to 60 years, they are considered as senior citizens.

Account Type	Interest Rate	
Savings Account (S)	Current amount $\leq$ 8000	4%
	Current amount > 8000	8%
Fixed Deposits (F)	Current amount $\leq$ 8000	10%
	Current amount > 8000	15%

User inputs the account type, balance amount of the account and the age of the account holder through the keyboard. The program should calculate and display the corresponding interest amount paid to the account holder. The program should take user inputs until the user enters an age less than 60. (Not a senior citizen)

```
#include <stdio.h>
int main()
{
    float balance, interestAmount;
    char type, answer;
    int age;
    printf("Enter age of the account holder : ");
    scanf("%d", &age);

Complete the following C program to solve the given expression. Use **Standard C math library function**.

$$C = \sqrt{a^2 + b^2 - 2ab \cos \theta}$$

Hint : if angle is 90 degrees, cosine will be  $\cos(90 * 3.141592/180)$

```
#include <stdio.h>
#include <math.h>
int main()
{
    float a = 3, b = 4, c;
    float angle = 90 * 3.141592/180;
    _____
    _____
    return 0;
}
```

## Question 17

Not yet answered

Marked out of 5.00

Flag question

Consider the following table having two columns. First column has line numbers and the second has different expressions. Write the line numbers of the relevant statements in correct order to obtain the following output

No	Supportive components for program writing
1	{
2	}
3	for(int j=0;j<=6;j++)
4	printf("* ");
5	for(int j=1;j<=6;j++)
6	printf("\n ");
7	for(int j=0;j<=16;j++)
8	for(int j=1;j == 6;j++)
9	for(int k=1;k<=6;k++)
10	for(int k=j;k<=6;k++)
11	if ( j == k)
12	else

Output

```
* * * * *
* * * * *
* * * * *
* * * * *
* * * * *
* * * * *
```

A company gives annual increments for their employees based on the following table.

Employee Category	increment %
A	4
B	6
C	8

increment amount = increment percentage \* salary

Implement a function called `calIncrement()` which calculates the increment when the salary and the employee category are passed as the parameters.

Question 15

Not yet answered

Marked out of 5.00

Flag question

A 2D array called **att** is used to store the attendance of 4 students in a class. A sample dataset is shown below.

1	0	1	1	1
1	1	1	1	1
1	1	0	1	1
1	1	1	1	1

Complete the following C code to determine and display the students (row number) who has attended to the class all five days.

In this example the students numbers are 2, 4

```
#include <stdio.h>
int main(void)
{
    int att[5][5] = {{1, 0, 1, 1, 1}, {1, 1, 1, 1, 1}, {1, 1, 0, 1, 1}, {1, 1, 1, 1, 1}, {1, 1, 1, 1, 0}};
    .....
    .....
    .....
    return 0;
}
```
